# Chapter 1. Introduction

Read [reference documentation](#)

webpack 4 examples:

- [starter without config file](#)
- [basic starter](#)
- [add html-webpack-plugin](#)
- [add webpack-dev-server](#)
- [add css-loader and style-loader](#)
- [process html and using html / file loaders](#)
- [using `extract-text-webpack-plugin` \(deprecated in order to `mini-css-extract-plugin`\)](#)
- [production build: minify everything, extract css...](#)
- [using `optimize-css-assets-webpack-plugin`](#)
- [using webpack config as a function](#)
- [babel webpack config](#)

# Chapter 2. Quickstart

## 2.1. no config

*using webpack without `webpack.config.js` file*

```
mkdir starter-no-config
cd starter-no-config/

mkdir src dist
echo "console.log('hey!');" >> src/index.js
echo "<script src='./main.js'></script>" >> dist/index.html

npm init -y
npm i -g webpack webpack-cli
#npm i -DE webpack webpack-cli

webpack --mode=development
webpack --mode production
```

## 2.2. basic config

*using webpack with basic config file: `config/webpack.dev.js`*

```
const { resolve } = require('path');

module.exports = {
  entry: {
    main: './src/index.js'
  },
  mode: 'development',
  output: {
    filename: '[name]-bundle.js',
    path: resolve(__dirname, '../dist'),
  },
};
```

## 2.3. add HTML plugin

*install `html-webpack-plugin`*

```
npm i -DE html-webpack-plugin
```

*update webpack config*

```
const HtmlWebpackPlugin = require('html-webpack-plugin');

module.exports = {
  // ...
  plugins: [
    new HtmlWebpackPlugin({
      template: './src/index.html',
      favicon: './src/favicon.ico',
    }),
  ],
};
```

## 2.4. add webpack-dev-server

*update webpack config*

```
const { resolve, join } = require('path');

module.exports = {
  // ...
  devServer: {
    contentBase: join(__dirname, '../dist'),
    // show / overlay errors in browser
    overlay: true,
  },
};
```

*install and run webpack-dev-server*

```
npm i -DE webpack-dev-server
webpack-dev-server --config config/webpack.dev.js
```

## 2.5. add css-loader and style-loader

*add some css styles*

```
body {
  margin: 0;
  background-color: #444;
}

/* lets centred content using flex */
#app {
  height: 100vh;
  display: flex;
  align-items: center;
  justify-content: center;
}

/* font styling */
h1 {
  color: white;
  font-size: 3em;
  font-family: Helvetica, sans-serif, 'DejaVu Sans', Arial;
  text-shadow: 0 0 25px white;
}
```

These loaders will apply in reverse order: first, **css-loader**, next: **style-loader**

*install css-loader and style-loader*

```
npm i -DE css-loader style-loader
```

*update webpack config*

```
module.exports = {
  // ...
  module: {
    rules: [
      {
        test: /\.css$/i,
        use: [
          { loader: 'style-loader' },
          { loader: 'css-loader' },
        ],
      },
    ],
  },
};
```

## 2.6. process html and using html / file loaders

prepare `./src/index.html`

```
<!doctype html>
<html lang="en">
<head>
  <meta charset="utf-8">
  <title>Webpack | Examples</title>
  <meta name="viewport" content="width=device-width, initial-scale=1">
  <link rel="shortcut icon" href="favicon.ico" type="image/x-icon">
  <link rel="stylesheet" href="styles.css">
</head>
<body>
  <div id="app"></div>
  <script src="main-bundle.js"></script>
</body>
</html>
```

Few thinks are happening here: First, `html-loader` will do necessary linting of `*.html` files. Then `extract-loader` will tell webpack do not include it in result `bundle.js` file. And finally `file-loader` will put extracted content in output dir accordingly

remove useless plugin and install requires loaders: `html-loader`, `extract-loader` and `file-loader`

```
npm rm -DE html-webpack-plugin
npm i -DE html-loader extract-loader file-loader
```

update webpack config

```
// const HtmlWebpackPlugin = require('html-webpack-plugin');

module.exports = {
  // ...
  /*
  plugins: [
    new HtmlWebpackPlugin({
      template: './src/index.html',
      favicon: './src/favicon.ico',
    }),
  ],
  module: {
    rules: [
      {
        test: /\.css$/i,
        use: [
          { loader: 'style-loader' },
          { loader: 'css-loader' },
        ],
      },
    ],
  },
}
```

```

    ],
  },
],
},
*/
module: {
  rules: [
    {
      test: /\.css$/i,
      use: [
        {
          loader: 'file-loader',
          options: {
            name: '[name].[ext]',
          },
        },
        { loader: 'extract-loader' },
        { loader: 'css-loader' },
      ],
    },
    {
      test: /\.html$/i,
      use: [
        {
          loader: 'file-loader',
          options: {
            name: '[name].[ext]',
          },
        },
        { loader: 'extract-loader' },
        { loader: 'html-loader' },
      ],
    },
    {
      test: /\.ico$/i,
      use: [
        {
          loader: 'file-loader',
          options: {
            name: '[name].[ext]',
          },
        },
      ],
    },
  ],
},
};

```

finally combine all together in `./src/index.js`

```
require('./index.html');
require('./styles.css');
require('./favicon.ico');
```

I wont use that approach, I prefer `HtmlWebpackPlugin` and `ExtractTextWebpackPlugin`

## 2.7. using extract-text-webpack-plugin

*install*

```
npm rm -ED style-loader
npm i -DE extract-text-webpack-plugin@next css-loader
# also add less support
npm i -DE less-loader less
```

*update webpack config*

```
const ExtractTextPlugin = require('extract-text-webpack-plugin');
const cssContent = new ExtractTextPlugin('[name]-[hash:8].css');
const lessContent = new ExtractTextPlugin('[name].less-[hash:8].css');

module.exports = {
  // ...
  module: {
    rules: [
      {
        test: /\.css$/i,
        use: cssContent.extract([
          'css-loader',
        ]),
      },
      {
        test: /\.less$/i,
        use: cssContent.extract([
          'css-loader',
          'less-loader',
        ]),
      },
    ],
  },
  plugins: [
    cssContent,
    lessContent,
  ],
};
```

There are better option available for using instead of extract text plugin: **mini-css-extract-plugin**

## 2.8. using mini-css-extract-plugin

*install*

```
npm rm extract-text-webpack-plugin
npm i -DE mini-css-extract-plugin
```

*update webpack config*

```
const mode = process.env.NODE_ENV || 'production';
const isProduction = mode === 'production';
const MiniCssExtractPlugin = require('mini-css-extract-plugin');

module.exports = {
  mode,
  // ...
  module: {
    rules: [
      {
        test: /\.css$/i,
        use: [
          isProduction ? MiniCssExtractPlugin.loader : 'style-loader',
          {
            loader: 'css-loader',
            options: {
              importLoaders: 1,
              minimize: isProduction,
            },
          },
          // 'postcss-loader',
          {
            loader: 'postcss-loader',
            options: {
              ident: 'postcss',
            },
          },
        ],
      },
    ],
  },
  plugins: [
    new MiniCssExtractPlugin({
      filename: '[name]-[hash:8].css',
    }),
  ],
};
```

*update package.json*

```
{
  "scripts": {
    "dev": "cross-env NODE_ENV=development webpack",
    "build": "cross-env NODE_ENV=production webpack",
    "start": "cross-env NODE_ENV=development webpack-dev-server --open"
  }
}
```

## 2.9. using optimize-css-assets-webpack-plugin

This plugin solves extract-text-webpack-plugin CSS duplication problem

*install*

```
npm i -DE optimize-css-assets-webpack-plugin
```

*update webpack config*

```
const OptimizeCssPlugin = require('optimize-css-assets-webpack-plugin');

module.exports = {
  // ...
  plugins: [
    isProduction ? new OptimizeCssPlugin() : undefined,
  ].filter(p => !!p),
};
```

## 2.10. using webpack config as a function

*remove useless packages*

```
npm rm cross-env
```

*update webpack config*

```
const safety = env => env || process.env || {};  
const mode = env => safety(env).NODE_ENV || 'production';  
const isProduction = env => 'production' === mode(env);  
  
module.exports = env => ({  
  mode: mode(env),  
  module: {  
    rules: [  
      {  
        test: /\.css$/i,  
        use: [  
          isProduction(env) ? MiniCssExtractPlugin.loader : 'style-loader',  
          {  
            loader: 'css-loader',  
            options: { importLoaders: 1 },  
          },  
          'postcss-loader',  
          {  
            loader: 'postcss-loader',  
            options: {  
              ident: 'postcss',  
            },  
          },  
        ],  
      },  
    ],  
  },  
  plugins: [  
    isProduction(env) ? new OptimizeCssPlugin() : undefined,  
    new webpack.DefinePlugin({  
      'process.env': {  
        NODE_ENV: JSON.stringify(mode(env)),  
      },  
    })  
  ].filter(p => !!p),  
});
```

## 2.11. babel setup (compare babel minify with uglifyjs)

*install required packages*

```
npm i -ED babel-core babel-loader babel-preset-env babel-preset-stage-0 babel-minify-  
webpack-plugin babel-plugin-transform-runtime babel-polyfill uglifyjs-webpack-plugin
```

prepare *.babelrc*

```
{
  "presets": [
    "stage-0",
    [
      "env",
      {
        "debug": false,
        "targets": {
          "browsers": [
            "last 2 versions",
            "safari >= 7",
            "chrome >= 52",
            "firefox >= 48"
          ]
        }
      }
    ]
  ],
  "plugins": [
    "transform-runtime"
  ]
}
```

```
const BabelMinifyPlugin = require('babel-minify-webpack-plugin');
// const UglifyJsPlugin = require('uglifyjs-webpack-plugin');

module.exports = env => ({
  entry: {
    main: [
      // 'babel-polyfill',
      './src/index.js',
    ],
  },
  {
    test: /\.css$/i,
    use: [
      isProduction(env) ? MiniCssExtractPlugin.loader : 'style-loader',
      {
        loader: 'css-loader',
        options: { importLoaders: 1 },
      },
      'postcss-loader',
      {
        loader: 'postcss-loader',
        options: {
          ident: 'postcss',
        },
      },
    ],
  },
],
},
{
  plugins: [
    // you decide with one is better:
    isProduction(env) ? new BabelMinifyPlugin() : undefined,
    // isProduction(env) ? new UglifyJsPlugin() : undefined,
    new webpack.DefinePlugin({
      'process.env': {
        NODE_ENV: JSON.stringify(mode(env)),
      },
    })
  ].filter(p => !!p),
});
```
